What You Need to Know About Long-Acting Injectables (LAIs)

Kayla Johnson, PharmD, BCPP, BCPP, January 2018

What is a Long-Acting Injectable (LAI)?
Long-acting injectables (LAIs) are Injectable medications used for individuals living with mental illness. LAIs are usually the same medication that is taken in pill form but when injected they allow for the slow release of medication into the blood over a longer period of time.

LAIs include: Abilify Maintena®, Aristada®, fluphenazine decanoate, haloperidol decanoate®, Invega Sustenna®, Invega Trinza®, Risperdal Consta®, Perseris®, and Zyprexa Relprevv®. The LAI can last anywhere from 2-12 weeks with just one dose, which helps to control symptoms of mental illness.

What are LAIs used for?
LAIs are usually given to treat psychosis (hallucinations or delusions) in individuals living with schizophrenia. Some LAIs may be used as mood stabilizers in individuals living with bipolar disorder.

How can a LAI help?
LAIs can help individuals stay on track with a medication plan. If someone is having trouble sticking to a plan, many things may happen. One problem could be needing to stay in a hospital until the illness is better. Other problems may include trouble with family and friends or other relationships.

When comparing LAIs to pill medications, LAIs may lower the chances of someone going to the hospital. LAIs allow for a steady level of medication in the blood. These steady levels help lower the chance of side effects. The LAIs may also help improve quality of life and satisfaction with medication.

How are LAIs given?
LAIs are given as an injection in the muscles of the arm or bottom. When starting a LAI for the first time, individuals may also have to take pill medication for a few weeks. The pill allows the injection to have time to start working.

Reasons individuals have trouble taking pill medications as directed
- They forget to take the medication
- They do not think they need it
- Side effects
- The medication costs too much

Advantages of LAIs
- Improvement in taking the medication
- Regular appointments with a doctor
- Steady levels of medication in the blood
- Less side effects from the medication

What if I am interested in a LAI?

If interested in a LAI, talk to a doctor. A LAI may not be right for every person living with mental illness. The main side effect of a LAI is pain at the injection site.\(^1\)\(^-\)\(^3\)

When talking to a doctor, here are some questions to ask:\(^4\)

- How will a LAI help?
- What symptoms will a LAI control?
- What side effects may occur?
- What blood work will need to be done

**Remember!**

- LAIs are medications which are made to help individuals living with mental illness.
- LAIs may help to reduce time in the hospital and increase quality of life.
- LAI injections are given every 2-12 weeks depending on which medication is best. This schedule may help individuals stick to a medication plan.
- For individuals worried about paying for a LAI, help may be available. Many insurance plans should help cover the cost of one of the LAIs. The drug company for each medication may also be able to help.
